FFP3 respirators protect healthcare workers against infection with SARS-CoV-2

<https://www.authorea.com/users/421653/articles/527590-ffp3-respirators-protect-healthcare-workers-against-infection-with-sars-cov-2?commit=e567e67501cd6ee0dd1a6e8e4acdf2c4fd70e0ec>

In Physics of Fluids (July 2021): “While higher ventilation capacities are required to fully mitigate aerosol build-up, even relatively low air-change rates (2 ACH) lead to lower aerosol build-up compared to the best performing mask in an unventilated space.” <https://aip.scitation.org/doi/pdf/10.1063/5.0057100>

MANY PRACTICAL RECOMMENDATIONS EXISTS

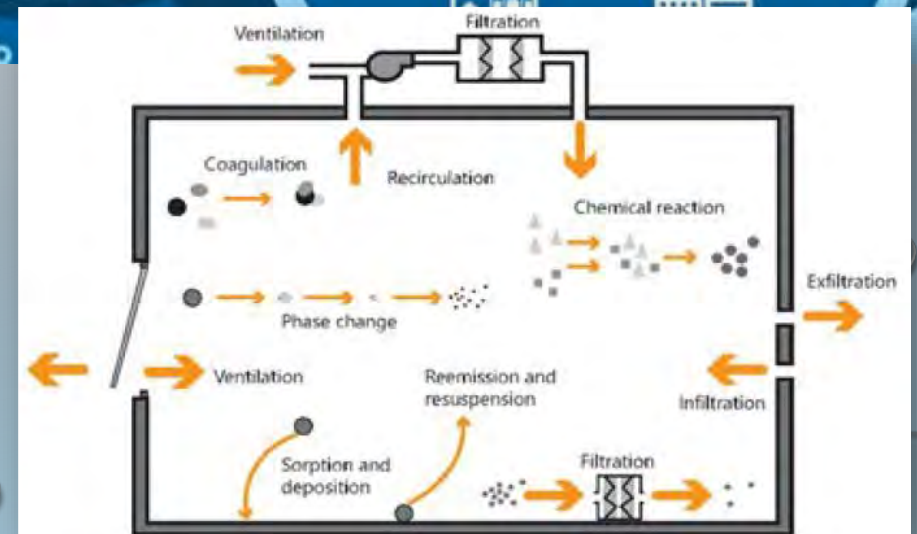

ASHRAE EPIDEMIC TASK FORCE

Core Recommendations for Reducing Airborne Infectious Aerosol Exposure

<https://www.ashrae.org/file%20library/technical%20resources/covid-19/core-recommendations-for-reducing-airborne-infectious-aerosol-exposure.pdf>

2. Ventilation, Filtration, Air Cleaning

- 2.1 Provide and maintain at least required minimum outdoor airflow rates for ventilation as specified by applicable codes and standards.
- 2.2 Use combinations of filters and air cleaners that achieve MERV 13 or better levels of performance for air recirculated by HVAC systems.
- 2.3 Only use air cleaners for which evidence of effectiveness and safety is clear.
- 2.4 Select control options, including standalone filters and air cleaners, that provide desired exposure reduction while minimizing associated energy penalties.

4 Practical recommendations for building services operation during an epidemic for infection risk reduction

MANY PRACTICAL RECOMMENDATIONS EXISTS

This REHVA guidance on building services operation covers 15 main items, as illustrated in Figure

1. Ventilation rates
2. Ventilation operation times
3. Overrule of demand control settings
4. Window opening
5. Toilet ventilation
6. Windows in toilets
7. Flushing toilets
8. Recirculation
9. Heat recovery equipment
10. Fan coils and split units
11. Heating, cooling and possible humidification setpoints
12. Duct cleaning
13. Outdoor air and extract air filters
14. Maintenance works
15. Indoor air quality (IAQ) monitoring

Figure 5. Main items of REHVA guidance for building services operation.

SELF-ASSESSMENT TOOL FOR CLASSROOM

(REF.: J. OUDYK, OHCOW)

- A TOOL TO GUIDE YOU IN DETERMINING THE CLASSROOM

Step #6: Final Results for Posting on your Classroom Door

Classroom Ventilation Posting

TOTAL equivalent ACH:

6.1

target: >6 to 12 ach

good: 5-6 ach

fair: 4-5 ach

bare minimum: 3-4 ach

poor: <3 ach

CO₂ ventilation performance indicator (enter measurement)

peak carbon dioxide (CO₂) concentration (in ppm):

no problem: <600 ppm CO₂

possible problem: 600-800 ppm CO₂

probable problem: 800-1000 ppm CO₂

more outdoor air needed: 1000+ ppm CO₂

Classroom Ventilation Posting

1a. type of ventilation system

HVAC constant flow unit ventilator natural ventilation/hot water/steam radiators

1b. room dimensions

length (in feet) width (in feet) height (in feet)

area (in square feet (ft²)): volume (in cubic feet (ft³)):

1c. room occupancy

room maximum capacity room typical capacity select which capacity (1=max, 2=typical)
 F' distancing achievable

2a. room ventilation rate

below ASHRAE 62.1 std

HVAC design flow rate (in cfm) cfm OA/person HVAC measured flow rate (in cfm)

proportion outdoor air supply (in %)

total air turnovers per hour

outdoor air changes per hour (OA ach)

3. filters

MERV rating date filter was last changed:

4. supplementary portable air filters

CADR @ top speed (in cfm of cleaned air)

CADR @ lowest speed (in cfm of cleaned air)

CADR @ typical speed (in cfm of cleaned air)

number of units

equivalent clean air ach

background noise somewhat exceeds ASHRAE recommendations

dB noise @ top speed

dB noise @ low speed

dB noise @ typical speed

select speed (1=max, 2=min, 3=typical)

5. supplementary fans

flow rate (in cfm)

RIA outdoor air (OA) or recirculating indoor air (RIA)

typical % time fan is on when room occupied

equivalent clean air ach

TOTAL equivalent ACH:

6.1

target: >6 to 12 ach

good: 5-6 ach

fair: 4-5 ach

bare minimum: 3-4 ach

poor: <3 ach

CO₂ ventilation performance indicator (enter measurement)

peak carbon dioxide (CO₂) concentration (in ppm):

no problem: <600 ppm CO₂

possible problem: 600-800 ppm CO₂

probable problem: 800-1000 ppm CO₂

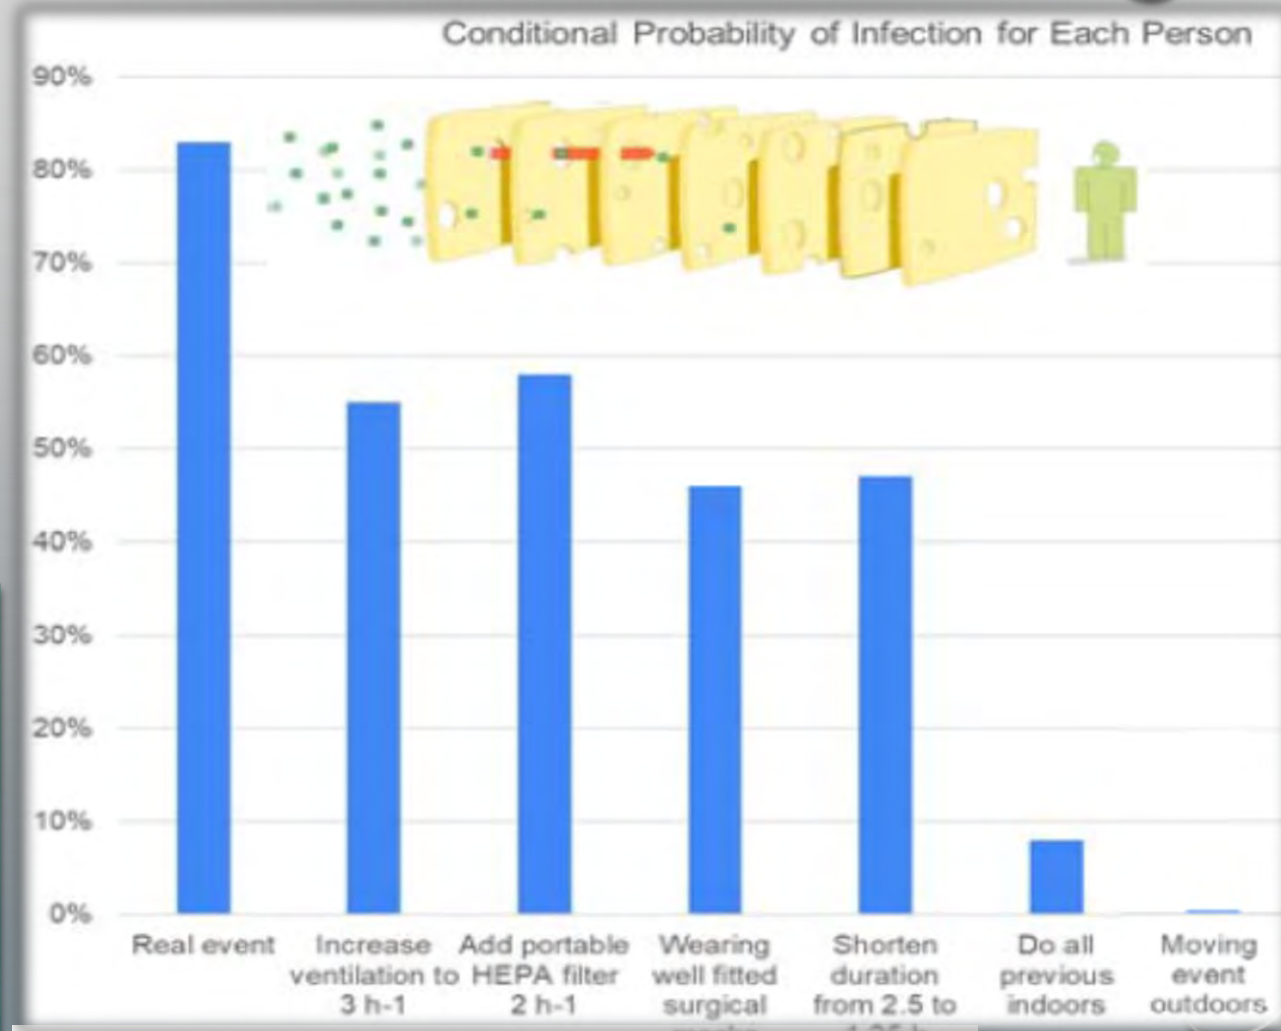

more outdoor air needed: 1000+ ppm CO₂

WHAT IS THE VALUE OF AIR PURIFIERS?

- EFFECTIVENESS OF HEPA OR MERV 13+ FILTERS
 - MEASURED IMPACT OF HEPA FILTERS ON INFECTION RATES FOR DIFFERENT SYSTEMS FOR 2 ROOM CONFIGURATIONS (FROM THE [SAGE-EMG NOVEMBER 2020 REPORT](#))
 - DIY OR COMMERCIAL: IMPORTANT TO HAVE GOOD FILTER(S) AND PROPER CAPACITIES

The best air purifiers (sometimes known as “air cleaners”) help to eliminate dust, pollen, smoke and other irritants from the air, but a good air purifier could also go a long way towards eliminating dangerous airborne threats.

- The CDC says air purifiers “can [help reduce airborne contaminants](#), including viruses, in a home or confined space.”
- The EPA (Environmental Protection Agency) adds that air purifiers [are helpful](#) “when additional ventilation with outdoor air is not possible”

Calculated with:

Swiss cheese graphic from Dr. Ian McKay

@smbilodeau

Things to look at before more complex options:

1. Increasing ventilation when possible (l/s)
2. Better control fresh air intake
3. Invest in CO2 monitoring
4. Improve Temperature and Humidity control
5. Think about Air Cleaner/HEPA filters
6. Open windows (last)

Natural ventilation

Natural forces (e.g. winds and thermal buoyancy force due to indoor and outdoor air density differences) drive outdoor air through purpose-built building envelope openings, such as windows, doors, solar chimneys, wind towers and trickle ventilators. This natural ventilation of buildings depends on climate, building design and human behaviour (8).

When wind strikes a building, it induces a positive pressure on the windward face and negative pressure on the leeward face. This drives the air to flow through windward openings into the building to the low-pressure openings at the leeward face (Figure 5). It is possible to estimate the wind pressures for simple buildings.

LIMITS TO WINDOWS' OPENING!

Source: Atkinson J, Chartier Y, Pessoa-Silva CL, Jensen P, Li Y. Natural ventilation for infection control in health-care settings. Geneva: World Health Organization; 2009.

Hint: If you need to open windows to ensure a minimum fresh air flowrate in the room, think of using bathroom or kitchen exhaust fans (as much as possible on the opposite side) to maximize aerosols and contaminants dilution.

A ROADMAP RATHER THAN A ONE-SIZE-FITS-ALL SOLUTION FOR A MORE COMPREHENSIVE SOLUTION TO INDOOR AIR QUALITY.

Roadmap to improve and ensure good indoor ventilation in the context of COVID-19

<https://www.who.int/publications/i/item/9789240021280>

The roadmap was developed after conducting a scoping review of the available literature and an assessment of the available guidance documents from the major internationally recognized authorities on building ventilation. The available evidence and guidance were retrieved, collated and assessed for any discrepancies by international expert members of the World Health Organization (WHO) Environment and Engineering Control Expert Advisory Panel

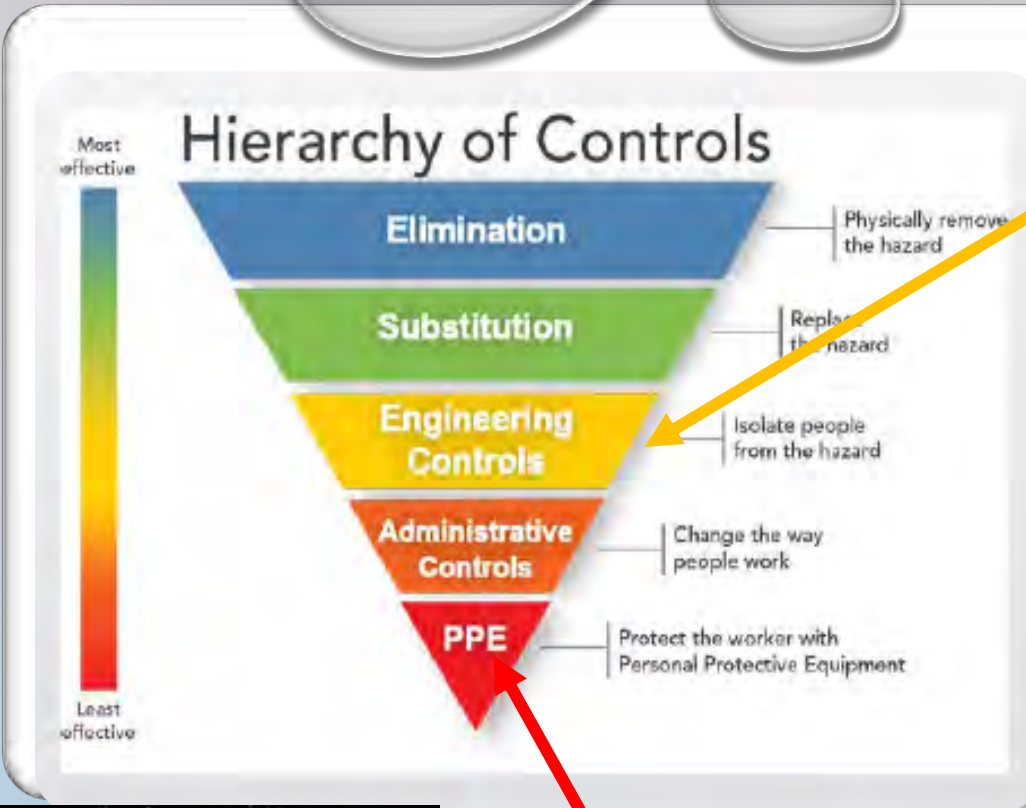

Executive summary

Context

The risk of getting COVID-19 is higher in crowded and inadequately ventilated spaces where infected people spend long periods of time together in close proximity. These environments are where the virus appears to spread by respiratory droplets or aerosols more efficiently, so taking precautions is even more important.

Understanding and controlling building ventilation can improve the quality of the air we breathe and reduce the risk of indoor health concerns including prevent the virus that causes COVID-19 from spreading indoors.

Ventilation Filtration

VENTILATION AND FILTRATION IN THE HIERARCHY OF CONTROL

Masks upgrade cuts infection risk, research finds (“Wearing a high grade mask known as an FFP3 can provide up to 100% protection.”)

June 28th, 2021: <https://www.bbc.com/news/health-57636360>

HOW TO IDENTIFY SOLUTIONS PROPERLY ADAPTED THE SITUATION?

A roadmap rather than a one-size-fits-all solution!

<https://www.who.int/publications/i/item/9789240021280>

With an Interdisciplinary Mindset: Facility Managers, Public Health, Occupational Health and Safety, with Engineering Support in a joint effort to implement solutions.

- To properly consider all aspects, not just the potential ability to remove or kill the virus.
- Within a class of devices, some are high quality and likely to be more effective.
- To optimize ventilation and supplement with (effective) air purifiers (where necessary).

To use engineering controls (Risk Management) effectively and safely.

- Advices and guidance to identify appropriate technologies and high quality products.
- Guidance and training for facilities managers and building services practitioners on the selection, design, installation and maintenance of air cleaning devices.

Things to look at before more complex options:

1. Increasing ventilation when possible (l/s)
2. Better control fresh air intake
3. Invest in CO2 monitoring
4. Improve Temperature and Humidity control
5. Think about Air Cleaner/ HEPA or MERV13+ filters
6. Open windows (last)
